

DAY6-SUMMARY.md — PrepGenie

Challenge Day: 56/60

Blueprint Day: Day 6 — Interview Chat UX Polish & Results Transition

Status: Code complete and delivered as downloadable files. Local integration, testing, and deployment are pending on the user's machine as of this submission.

What Was Completed Today

Building on the Day 5 (Day 55) mock interview engine, five files were generated to complete the remaining Day 6 blueprint scope for the interview chat experience:

- **Voice-to-text input** — a custom useSpeechToText hook wrapping the browser's native Web Speech API (SpeechRecognition), with feature detection so the microphone control only appears in supported browsers.
- **Skip question control** — lets the candidate skip a question without breaking the session's answer sequence; recorded server-side as an explicit "skipped" answer via the existing /api/interview/answer endpoint.
- **End interview early control** — allows the candidate to exit the interview before all questions are answered and routes directly to the results screen with the partial answer count.
- **Typing indicator** — a lightweight animated component shown between questions to simulate realistic interviewer pacing.
- **Transition to Interview Results screen** — a new InterviewResults page that the chat flow now redirects to on completion (or early end). This screen intentionally shows an honest "AI scoring coming soon" state rather than fabricated scores.
- **Required footer attribution** — Footer.jsx was finalized to permanently display: "Built with Claude as part of the AB Talks 60-Day Claude AI Challenge."

Files Created or Replaced

File	Status	Purpose
client/src/hooks/useSpeechToText.js	NEW	Browser-native voice-to-text, no external API
client/src/components/TypingIndicator.jsx	NEW	Animated "interviewer is thinking" indicator
client/src/components/Footer.jsx	REPLACED	Finalized with required challenge attribution text
client/src/pages/InterviewResults.jsx	NEW	Post-interview completion screen (scoring pending)
client/src/pages/InterviewChat.jsx	REPLACED	Adds voice input, skip, end-early, typing indicator, results redirect

All five files were provided as complete, copy-pasteable downloadable artifacts. No backend changes were required — the existing POST /api/interview/answer endpoint (built Day 5) already supports every new frontend interaction without modification.

Manual Steps Identified (Not Yet Confirmed Complete)

Two integration points could not be safely generated without seeing their existing contents, and were handed off as manual instructions:

- client/src/App.jsx — requires adding an import and a new route for /interview/:sessionId/results.
 - client/src/components/Layout.jsx — requires verifying <Footer /> is actually rendered site-wide.
- As of this summary, the user has not yet confirmed these manual edits were applied or tested locally.

Testing / Verification Performed

No local testing, build verification, or deployment has been confirmed completed in this conversation as of this summary. The following remain outstanding before Day 56 can be marked fully done:

- ■ Manual App.jsx route added
- ■ Layout.jsx footer rendering confirmed
- ■ npm run dev local run confirmed working
- ■ Full interview flow (start, answer/skip/voice, end or complete, results screen) manually tested
- ■ Production build (npm run build) verified with zero errors
- ■ MVP deployed to free-tier hosting
- ■ Live URL smoke-tested
- ■ Screenshots of the working live app captured

Simplifications Made (By Design, Not Shortcuts)

- The Interview Results screen deliberately does not show AI-generated scores today — fabricating scores would misrepresent the AI's actual capability at this stage and was explicitly avoided.
- Voice-to-text uses the free, built-in browser API rather than any paid speech-to-text service, keeping the project at \$0 cost as required.

Free Tools/Services Used Today

Browser-native Web Speech API (SpeechRecognition) — no cost, no external account required. No new AI provider, database, or hosting service was introduced today.

Deployment Status

Not yet deployed. Deployment (Vercel for frontend, Render for backend — both free tier, consistent with the existing architecture) is prepared as the next step but has not been executed or confirmed in this conversation.

Key Learnings

- Designing the Results screen to honestly reflect "scoring not yet implemented" rather than mocking fake data preserves user trust and avoids technical debt.
- Reusing the existing /api/interview/answer contract for both "skip" and "normal answer" flows avoided any backend changes, keeping Day 6 strictly a frontend UX day as scoped.
- Splitting file generation from manual integration steps (for files whose current contents weren't available) prevented accidental overwrites of working Day 53-55 code.

What Remains for Day 57

- Complete the manual App.jsx and Layout.jsx integration steps and confirm locally.
- Verify the production build.
- Deploy the MVP to free-tier hosting and confirm the live URL.
- Capture screenshots of the live, working application.
- Begin Day 7 scope: AI-based interview answer scoring (POST /api/interview/complete) and the real results breakdown to replace today's "coming soon" placeholder.
